## Series 200

## I/O System Units

7The Series 200 I/O System features a number of interface units for various process applications. The I/O units are compatible with the I/O 200C units and can be mixed with them in any order on the same DIN rail.

The units in the I/O system are intended for use in industrial environment and they fulfil the EMC directive 89/336/EEC. The I/O units may be mounted centrally at the Central System or remotely.

The inputs and outputs are filtered and galvanically isolated by optocouplers.

Configuration of the I/O units' functions and measuring ranges is performed using the system software.
The units of Series 200 are used by SattCon 200 and SattLine to varying extents, and in various combinations.

The Series 200 I/O System features:

- Replacement under system power
- CE and UL approvement
- Software configurable function
- Mechanical coding for safe replacement
- Safety function on outputs in remote configuration
- Variety of termination options
- The same I/O units in central and remote configurations
- Compatible with I/O 200C

## I/O Units

The in/outputs are filtered and galvanically isolated by optocouplers. LEDs are located on the front.
It is possible under system power to remove/insert the units. The process is connected to the units via the terminal base. Power for the internal logic is provided on the serial bus via the adapter for the I/O system.
The use of I/O units and their functionality with SattCon 200 and SattLine systems is dependent on certain system versions and configurations. Please refer to the relevant manuals or data sheets.

## 200-IB16

I/O unit for 16 digital input signals. The status of each input signal is indicated by a yellow LED.
Each signal is isolated from the logic circuits by an optocoupler and filtered with a low-pass filter. The inputs share a common ground connection.
The input signals are sampled at intervals determined by a filter time. The signal status is changed only if two consecutive samples are the same. The filter time is set with the programming software.
200-IB16 contains a counter.

200-OB16, 200-OB16P

I/O units for 16 digital output signals. The outputs of 200-OB16P are shortcircuit proof. Up to four outputs can be connected in parallel (the total load must, however, not exceed 1.8 A ).
The status of each output signal is indicated by a yellow LED if +24 V DC is supplied.
The 16 outputs share a common ground connection.

## 200-IB10xOB6

I/O unit for ten digital input and six digital output signals. The status of each signal is indicated by a yellow LED.

The outputs can deliver up to 2 A to the I/O system.

Each signal is isolated from the logic circuits by an optocoupler and filtered with a low-pass filter. The inputs have a programmable filter time.

## 200-IE8

I/O unit for eight analogue input signals. The unit has 12-bit resolution and each of the inputs can be either a voltage ( $0-$ 10 V DC, $\pm 10 \mathrm{~V}$ DC) or a current ( $0-$ $20 \mathrm{~mA}, 4-20 \mathrm{~mA}$ ) input. Selection of voltage or current is made both by the programming software and by the input on the terminal base unit.

One green LED indicates power on/ off.
The inputs are, as a group of eight, galvanically isolated from the system by optocouplers and the eight inputs are single ended.
An additional power supply is required.

## 200-OE4

I/O unit for four analogue output signals. The unit has 12 -bit resolution and each of the outputs can be either a voltage ( $0-10 \mathrm{~V} \mathrm{DC}, \pm 10 \mathrm{~V} \mathrm{DC}$ ) or a current ( $0-20 \mathrm{~mA}, 4-20 \mathrm{~mA}$ ) output. Selection of voltage or current is made both by the programming software and by the output on the terminal base unit.

One green LED indicates power on/ off.
The outputs are, as a group of four, galvanically isolated from the system by optocouplers.
An additional power supply is required.

## 200-IE4xOE2

I/O unit for four analogue input and two analogue output signals.

Selection of voltage or current is made both by the programming software and directly on the terminal base unit.

One green LED indicates power on/ off.

The inputs and the outputs are, as a group, galvanically isolated from the system by optocouplers.

An additional power supply is required.

## 200-IP2

I/O unit with two pulse transmitter interfaces, each with four optocoupled inputs. The maximum pulse frequency is 100 kHz . The I/O unit is configured using the control system program.

200-IP2 can be adapted for a wide range of applications, for example, for counting pulses from pulse transmitters or incremental encoders with one or two pulse trains. Quantity counting, positioning and speed calculation are examples of other applications.

200-IP2 has two 16-bit up/down counters, which are individually programmable. The number of edges to be counted in a pulse train can be specified to x 1 , x 2 or x 4 .
Complementary or noncomplementary pulse transmitters can be connected.
The status of each input signal is indicated by a yellow LED. One bicoloured LED indicates function status.

I/O unit with four pulse transmitter interfaces, each with two optocoupled inputs. The maximum pulse frequency is 100 kHz . The I/O unit is configured using the control system program.

200-IP4 can be adapted for a wide range of applications, for example, for counting pulses from flow and density meters, quantity counting and speed calculation.

200-IP4 has two 16-bit counters per channel. Each can be individually configured for either period time measurement, using one 16 -bit counter and accumulating pulse counting using the other 16-bit counter or period time measurement using a 32 -bit counter.

An internal clock ( 1 or 10 MHz ) is used for the period time measurement.

The status of each input signal is indicated by a yellow LED. One bicoloured LED indicates function status.

## 200-IT8

I/O unit for eight thermocouple input signals with programmable filters and 16-bit resolution. One bi-coloured LED indicates power on/off.

Terminal base unit TB3T must always be used. An additional power supply is required.

## 200-IR8

I/O unit for eight three-wire RTD input signals with programmable filters and 16-bit resolution. A number of sensors are supported. One bi-coloured LED indicates function status.
The inputs are, as a group of eight, galvanically isolated from the system by optocouplers. Each channel can be turned off to improve system throughput.

An additional power supply is required.

## 200-IR8R

I/O unit for eight four-wire RTD input signals. The inputs have programmable filters and 16 -bit resolution. One sensor type is supported.

The status of each input signal is indicated by a yellow LED. A green LED indicates function status.
The inputs are, as a group of eight, galvanically isolated from the system by optocouplers. Each channel can be turned off to improve system throughput.
An additional power supply is required.

## 200-IA8

I/O unit for eight digital 120 V AC input signals. The status of each input signal is indicated by a yellow LED. Each signal is filtered with a low-pass filter.

The input signals are sampled at intervals determined by the filter time. The signal status is changed only if two consecutive samples are the same. The filter time is set with the programming software.
The eight inputs share a common voltage connection.

200-0A8

I/O unit for eight digital 120 V AC output signals. The status of each output signal is indicated by a yellow LED.
Output indicators will not work unless 120 V AC is supplied.
The eight outputs share a common 0 V AC connection.

## 200-OW8

I/O unit for eight relay output signals. The status of each output signal is indicated by a yellow LED.
If the voltage exceeds 132 V , terminal base unit $200-\mathrm{TBN}$ or $200-\mathrm{TBNF}$ must be used.
An additional power supply is required.

## 200-OB8EP

I/O unit for eight short-circuit proof output signals. The unit is intended for detection of short-circuit condition in its output circuit or low impedance loads causing excessive current drain. Each of the eight output channels has a current sensing circuit. The unit is designed to allow up to 2.0 A current per channel.
The status of each output signal is indicated by a yellow LED. Diagnostics are carried out for each output and a fault is indicated by a red LED.
By pressing a manual reset button, all output faults are reset simultaneously. Diagnostics and reset functions are fully accessible from the application.
The eight outputs share a common ground connection.

| General specifications |  | ON-state current | 1.0 mA min. per channel 450 mA max. per channel when in |

Type R: $-50-+1768^{\circ} \mathrm{C}$
Type S: -50-+1768 ${ }^{\circ} \mathrm{C}$
Type T: $-270-+400^{\circ} \mathrm{C}$
3 W at 31.2 V DC max.
1 BOOH
3

24 V DC nom. (19.2-31.2 V DC)
60 mA at 24 V DC
5-95\%, non-condensing
5-80\%, non-condensing
200-IT8

## 200-IR8

Number of inputs 8
Galvanic isolation Yes (via optocouplers)
Status indicators Bi-colour (green/red) LED for Power
Resolution
Input range
Overvoltage
capability
Filter
Accuracy without
calibration and at low humidity levels

16-bit across $435 \Omega$
1-433 $\Omega$
$\pm 35 \mathrm{~V}$ DC, 25 V AC continuous at $25^{\circ} \mathrm{C}$,
250 V peak transient
Programmable
$0.05 \%$ of FSR max. in normal mode ( $0.01 \%$ of FSR typ. in enhanced mode) at $25^{\circ} \mathrm{C}$
